## Latin Squares

## Definition

Let $n$ be a positive integer. A Latin square of order $n$ is an $n \times n$ matrix of $n$ symbols such that each symbol occurs exactly once in each row and column.

| 1 | 2 | 3 | 4 | 5 |
| :--- | :--- | :--- | :--- | :--- |
| 2 | 4 | 1 | 5 | 3 |
| 3 | 5 | 4 | 2 | 1 |
| 4 | 1 | 5 | 3 | 2 |
| 5 | 3 | 2 | 1 | 4 |

## Subsquares

## Definition

Let $L$ be a Latin square of order $n$. A subsquare of $L$ is a submatrix of $L$ which is itself a Latin square. A subsquare of $L$ of order $k$ is proper if $1<k<n$.

| 6 | 1 | 5 | 4 | 3 | 2 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 4 | 5 | 1 | 6 | 2 | 3 |
| 2 | 4 | 6 | 3 | 5 | 1 |
| 1 | 3 | 2 | 5 | 6 | 4 |
| 3 | 6 | 4 | 2 | 1 | 5 |
| 5 | 2 | 3 | 1 | 4 | 6 |

## $N_{\infty}$ Latin squares

## Definition

A Latin square is called $N_{\infty}$ if it contains no proper subsquares.

| 2 | 3 | 4 | 5 | 1 |
| :--- | :--- | :--- | :--- | :--- |
| 3 | 4 | 5 | 1 | 2 |
| 4 | 5 | 1 | 2 | 3 |
| 5 | 1 | 2 | 3 | 4 |
| 1 | 2 | 3 | 4 | 5 |

## $N_{\infty}$ Latin squares

## Definition

A Latin square is called $N_{\infty}$ if it contains no proper subsquares.

| 2 | 3 | 4 | 5 | 1 |
| :--- | :--- | :--- | :--- | :--- |
| 3 | 4 | 5 | 1 | 2 |
| 4 | 5 | 1 | 2 | 3 |
| 5 | 1 | 2 | 3 | 4 |
| 1 | 2 | 3 | 4 | 5 |

The Cayley table of a cyclic group of prime order is $N_{\infty}$.

## $N_{\infty}$ Latin squares

| $n$ | Species of Latin squares | Species of $N_{\infty}$ Latin squares |
| :---: | :---: | :---: |
| 1 | 1 | 1 |
| 2 | 1 | 1 |
| 3 | 1 | 1 |
| 4 | 2 | 0 |
| 5 | 2 | 1 |
| 6 | 12 | 0 |
| 7 | 147 | 2 |
| 8 | 283657 | 3 |
| 9 | 19270853541 | 1589 |

$N_{2}$ Latin squares are rare. Kwan, Sah, Sawhney and Simkin showed that the probability of a random Latin square of order $n$ being $N_{2}$ is $\exp \left(-\Omega\left(n^{2}\right)\right)$.

## $N_{\infty}$ Latin squares

Theorem
There exists an $N_{\infty}$ Latin square of order $n$ for all $n$ not of the form $2^{a} 3^{b}$ with $a \geqslant 1$ and $b \geqslant 0$.

- It is conjectured that there exists an $N_{\infty}$ square of order $n$ for all sufficiently large $n$ (Hilton 1974).
- There exists an $N_{\infty}$ square of order $p q$ whenever $p$ and $q$ are distinct primes with $p q \neq 6$ (Heinrich 1980).
- There exists an $N_{\infty}$ square of all orders not of the form $2^{a} 3^{b}$ with $a \geqslant 0$ and $b \geqslant 0$ (Andersen and Mendelsohn 1982).
- There exists an $N_{\infty}$ square of order $3 m$ for all odd integers $m$ (Maenhaut, Wanless, and Webb 2007).

## $N_{\infty}$ Latin squares

We construct an $N_{\infty}$ of order $n$ for each $n$ of the form $2^{a} 3^{b} \notin\{4,6\}$ with $a \geqslant 1$ and $b \geqslant 0$.

Theorem
There exists an $N_{\infty}$ Latin square of order $n$ for all $n \notin\{4,6\}$.

## Direct products

Let $L$ be a Latin square of order $n$ and let $M$ be a Latin square of order $m$. The direct product of $L$ and $M$, denoted by $L \times M$, is a Latin square of order $n m$ whose row indices, column indices and symbols are in the set $[n] \times[m]$. It is defined by

$$
(L \times M)_{(i, j),(k, \ell)}=\left(L_{i, k}, M_{j, \ell}\right)
$$

Consider the following two Latin squares.

$$
L=\begin{array}{|l|l|}
\hline 1 & 2 \\
\hline 2 & 1 \\
\hline
\end{array}
$$

$M=$| 1 | 2 | 3 |
| :--- | :--- | :--- |
| 2 | 3 | 1 |
| 3 | 1 | 2 |.

## Direct products

The following is $L \times M$ where we order the rows and columns by the first coordinate, and use the second to break ties.

| $(1,1)$ | $(1,2)$ | $(1,3)$ | $(2,1)$ | $(2,2)$ | $(2,3)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $(1,2)$ | $(1,3)$ | $(1,1)$ | $(2,2)$ | $(2,3)$ | $(2,1)$ |
| $(1,3)$ | $(1,1)$ | $(1,2)$ | $(2,3)$ | $(2,1)$ | $(2,2)$ |
| $(2,1)$ | $(2,2)$ | $(2,3)$ | $(1,1)$ | $(1,2)$ | $(1,3)$ |
| $(2,2)$ | $(2,3)$ | $(2,1)$ | $(1,2)$ | $(1,3)$ | $(1,1)$ |
| $(2,3)$ | $(2,1)$ | $(2,2)$ | $(1,3)$ | $(1,1)$ | $(1,2)$ |

## Direct products

The following is $L \times M$ where we order the rows and columns by the second coordinate, and use the first to break ties.

| $(1,1)$ | $(2,1)$ | $(1,2)$ | $(2,2)$ | $(1,3)$ | $(2,3)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $(2,1)$ | $(1,1)$ | $(2,2)$ | $(1,2)$ | $(2,3)$ | $(1,3)$ |
| $(1,2)$ | $(2,2)$ | $(1,3)$ | $(2,3)$ | $(1,1)$ | $(2,1)$ |
| $(2,2)$ | $(1,2)$ | $(2,3)$ | $(1,3)$ | $(2,1)$ | $(1,1)$ |
| $(1,3)$ | $(2,3)$ | $(1,1)$ | $(2,1)$ | $(1,2)$ | $(2,2)$ |
| $(2,3)$ | $(1,3)$ | $(2,1)$ | $(1,1)$ | $(2,2)$ | $(1,2)$ |

## Corrupted products

- Let $A$ be an $N_{\infty}$ square of order $n$.
- Let $B$ be a Latin square isotopic to $A$, such that $A[i, j]=B[i, j]$ if and only if $i=j=1$.
- Let $M$ be an $N_{\infty}$ square of order $m$.
- Let $s \in[m-1]$.

## Corrupted products

The corrupted product of $(A, B)$ and $M$ with shift $s$, denoted by $P=(A, B) *_{s} M$, is a Latin square of order nm whose row indices, column indices, and symbols are in the set $[n] \times[m]$. It is defined by,

$$
P[(i, j),(k, I)]= \begin{cases}(A[i, k], M[j, l]+s) & \text { if } i=k=1 \\ (B[i, k], M[j, I]) & \text { if } j=I=1 \text { and }(i, k) \neq(1,1), \\ (A[i, k], M[j, l]) & \text { otherwise. }\end{cases}
$$

This was introduced by Wanless.

## Corrupted products

## Corrupted products

## Corrupted products

Theorem (Wanless 2001)
The corrupted product $(A, B) *_{s} M$ has only one proper subsquare (provided some mild conditions on $(A, B), M$ and $s$ hold).

## Cycle switches

| 1 | 2 | 3 | 4 | 5 |
| :--- | :--- | :--- | :--- | :--- |
| 2 | 4 | 1 | 5 | 3 |
| 3 | 5 | 4 | 2 | 1 |
| 4 | 1 | 5 | 3 | 2 |
| 5 | 3 | 2 | 1 | 4 |$\rightarrow$| 1 | 2 | 3 | 4 | 5 |
| :--- | :--- | :--- | :--- | :--- |
| 5 | 4 | 2 | 1 | 3 |
| 3 | 5 | 4 | 2 | 1 |
| 4 | 1 | 5 | 3 | 2 |
| 2 | 3 | 1 | 5 | 4 |

## Constructing $N_{\infty}$ squares

We used a recursive construction to build $N_{\infty}$ Latin squares for all orders of the form $2^{a} 3^{b}$. Our method was as follows:

- Find a pair $\left(A_{8}, B_{8}\right)$ of Latin squares of order 8 and a pair $\left(A_{9}, B_{9}\right)$ of Latin squares of order 9 which satisfies certain properties.
- Given an $N_{\infty}$ square $M$ of order $m$ which satisfies some nice properties, construct corrupted products $\left(A_{8}, B_{8}\right) *_{1} M$ of order $8 m$ and $\left(A_{9}, B_{9}\right) *_{1} M$ of order $9 m$, both of which have a unique subsquare.
- Switch the corrupted product on a row cycle of length three which hits the unique subsquare exactly once, in such a way as to not introduce any new subsquares.

## Conclusion

- We resolved the existence problem for $N_{\infty}$ Latin squares and $N_{\infty}$ Latin hypercubes.
- It is likely that a similar approach would work to construct $N_{\infty}$ squares of other orders.
